

Flaky Test

1. What is a flaky test?

Flaky test is a condition when we do the same steps while testing a feature, but it can give different result: Pass and Fail. This often happen related to issue or bug that occurred intermittently. Even we already do the same steps even the same data to test a feature, the bug maybe sometime occurred but sometime not occurred.

2. An element in a website is using ajax/javascript to show the data (processed as asynchronous). What do you do to test that element?

- a. Click element that triggered the event to check.
- b. Check the event detail on database, the most important things to check like: timestamp, event name, element name and etc.

3. A website page can only be accessed with CAPTCHA. How do you test that page?

Positive Case

- a. Insert the keyword on the text box as same as displayed keyword on CAPTCHA.

ex:

Negative Case

- a. Insert empty keyword on the text box.
- b. Insert the keyword with data less than keyword on CAPTCHA on the text box.
- c. Insert the keyword with data more than keyword on CAPTCHA on the text box.
- d. Insert the keyword on the text box as same as displayed keyword on CAPTCHA but ignore the upper/lower case.
- e. Insert the different keyword on text box.
